                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     251
                                                                                                                                                                                                                                                                                                                                                                               WPI; 91-3197.8/44.

WP-PSDB; Q14239.

New Mater-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. Claim 2; Page 45; 52pp; French.

The transmembrane and cytoplasmic domains of the native IFN receptor have been deleted to obtain a soluble, circulating form of the receptor. Potentially immunogenic epitopes have thus been eliminated. Derivatives obtained as are hybrid molecules comprising the soluble receptor (or deriv.) and an immunoglobulin such as IgG1.

New mammalian soluble interferon alpha-receptor forms - used for inhibiting, modulating or modifying the activities of interferon(s) Example 3; Fig 7; 46pp; English.

C (W21806) is characterised by a double deletion when compared to transmembranal IFNAR (W21804). The extracellular domain in transmented by 6 amino acid residues and is followed by a truncated intracellular domain. There is no transmembrane region. The amino acid sequence is predicted from a cDAN clore (see also T73521) obtd. From human myeloma U266 cells. Soluble, non-membrane bound IFNAR Splice-deleted forms 1 (see also W21805) and 2 may regulate the response of human cells to IFNA, either by acting as IFN antagonists or by regulating IFN activities. They can be expressed activities of IFNs alpha and beta in cells, tissues and organisms, Sequence 495 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-MAY-1995.

New human alpha-interferon receptor protein - useful for testing interferon agonists and in treatment or diagnosis interferon agonists and in treatment or diagnosis pisclosure; fig 4; 30pp; French.

This recombinant human alpha interferon (IFN) receptor protein is useful for the testing of IFN agonists and for treatment and diagnosist of viral diseases and tumours. Antibodies raised against this protein can be used for blocking the receptor when required, this protein can be used for blocking the receptor when required, eg where overexpression of alpha-IFN is harmful. The Abs are eg where overexpression of alpha-IFN is harmful. The Abs are having residue 164 (Thr) replaced by Arg and an Asp inserted between residues 479 and 480, are also useful.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       251
                     New water-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, beta - used to treat e.g. lupus erythematosus, Behcet's disease, beta - used to treat e.g. lupus erythematoid arthritis, etc. aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. pisclosure; Page 47; 52pp; French.

The invention covers derivatives of the interferon-alpha and/or beta receptor obtained by deleting the transmembrane and cytoplasmic domains receptor obtained by deleting the transmembrane and cytoplasmic domains of the native receptor or by substitution. Potentially immunogenic epitopes are eliminated and the deriv. can be secreted from epitopes are eliminated and the deriv. Block the activity of IFN alpha/beta and can be used to treat autoimmune diseases or to inhibit graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                            117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     351
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              67

water soluble polypeptide(s) strongly bind interferon(s) alpha and beta - useful as immunosuppressants, for treating auto: immune diseases and transplant rejection
Claim 3; Fig 2; 58pp; English.
DNA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate oligonucleotides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (030533), was incubated with oligos Q30534 and Q30535. R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.

Compsn. of monoclonal antibodies against interferon receptor useful as immuno:modulator, eg. for treating AIDS Disclosure; Fig.3A-2B; 105pp; English.

The amino acid sequence of human interferon class I receptor is given in R75356. A recombinant soluble form of the extracellular domain of this receptor (R71723) has been used to raise immunomodulatory monoclonal antibodies.

New mammalian soluble interferon alpha-receptor forms - used for inhibiting, modulating or modifying the activities of interferon(s) plsclosure; Fig 7: 46pp; English.

Human transmembranal interferon alpha receptor (IFNAR) (W21804) includes a 21-amino acid transmembrane region. Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21806) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polyapetides can be expressed in host cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic

CC This represents the Zcytor7 cytokine receptor. Zcytor7 is a ligand-composition of the zcytor containing the Zcytor CC This represents the Zcytor7 cytokine receptor containing the Zcytor CC receptor family (CRF2). An expression vector containing the Zcytor CC receptor family (cRF2). An expression vector containing the Zcytor CC concoding a transmembrane and intracellular domain, or both, and a CC transcriptional terminator can be used to transform host cells for the CC transcriptional terminator can be used to transcriptional terminator of the polypeptide. The sequences can be used to study the Zcytor7 gene and to isolate ligands binding to it. Zcytor7 is C tissue. Agonists of Zcytor7 can be used to stimulate proliferation and CC differentiation of cell in these organs. The antagonists and agonists can calso be used in the treatment of renal, neural, pancreatic and prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PS Claim 2; Page -; 79pp; English.

PS Claim 2; Page -; 79pp; English.

CC rimis sequence is the human CRFB4 sequence, DNA encoding it is used in the CC recombinant DNA (I) of the invention. (I) comprises a sequence (S1) CC encoding the interleukin-10 (IL-10) receptor (IL10R) and a sequence (S2) CC encoding CRFB4, both operably linked to expression control sequences. CC cells containing (I) may be used to identify agonists/antagonist of CC cells containing (I) may be used to identify agonists/antagonists are potentially useful, e.g. for preventing allograft CC rejection, as vaccine adjuvants, for treatment of photosensitivity. CC rejection, as vaccine adjuvants, for treatment of photosensitivity contributed in the contributed contributed in the contributed in the contributed contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       alignment_block:

The sequence was deduced from the nucleotide sequence (see (x24379) of a cDNA clone obtained from pancreatic islet cDNA (library. Ccytoril is a cell surface receptor that is expressed in cellibrary. Small intestine, colon and thymus. Novel Ccytoril (polypeptides, especially an extracellular domain (see W97864) of cellibrary colon and/or differentiation of these organs. The color proliferation and/or differentiation of these organs. The invention provides claimed expression vectors and transformed or transfected cells, as well as an antibody that specifically binds to the extracellular domain of Ccytoril, and an anti-idiotyptic antibody. The vectors include a promoter, a terminator and DNA encoding the extracellular domain, signal sequence, transmembrane commain or intracellular domain of Ccytoril.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Align seg 1/1 to: W97861 from: 1 to:

The IFN-gamma receptor beta-subunit encoded by a cDNA clone derived from mouse B-cells is given in R75782. Recombinant beta-subunit, pref. with the transmembrane anchoring domain deleted or inactivated and with the cytoplasmic domain deleted, may be may be used to treat pathological conditions associated with endogenous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (AGUE/) AGUET M.
